

# MMS/Email Mapping

draft-ietf-lemonade-mms-mapping-01

# Open Issue #1

- Retain precedence: Bulk as:
  - MAY be inserted for class=auto or class=advertisement.
  - If so, need to standardize?
  - If not, say anything about these classes?

# Open Issue #2

- Requests for sender address hiding may be transmitted in the ESMTP envelope by using the X-ANONYMOUS extension. The request is made by adding "X-ANONYMOUS" to the MAIL FROM command. Servers which support address hiding may advertise this by including X-ANONYMOUS in their EHLO response. Note that even if servers claim to support address hiding, there is no technical guarantee that it will be properly honored; servers **MUST NOT** trust other servers to support this without a basis which is beyond the scope of this specification (such as business relationships).
  - Retain the x-anonymous envelope extension?
  - If so, formally define it here or in another doc?
  - (Intent was to permit but not endorse due to risks)
